SERVICE 01

AgentOS

Build, Deploy & Orchestrate Custom AI Agents

AgentOS is a production-ready multi-agent orchestration platform built for teams that need AI to do real work — not just answer questions. Define any workflow in natural language or structured config, and a network of specialized AI agents executes it end-to-end.

Unlike rigid preset-based tools, AgentOS supports **fully custom workflows**. You bring the process — lead research, code review, document processing, competitive analysis, onboarding automation, or anything else — and AgentOS breaks it down, assigns it to the right agents, coordinates execution, and returns structured output.

KEY CAPABILITIES

- Custom workflow creation — any multi-step process
- Persistent memory across sessions and tasks
- Real-time observability of agent activity
- Multi-agent coordination in parallel or sequence
- Tool use: web, code, APIs, files
- LLM-agnostic: Claude, GPT-4, and others

WHAT YOU CAN AUTOMATE

Software development pipelines · Research & summarization · Lead qualification · Document review · Customer support triage · Data extraction · Content generation · Internal ops · Any custom process you define

BUILT WITH

Python	Next.js	PostgreSQL
Claude API	OpenAI API	FastAPI

SERVICE 02

SmartCart Knowledge Assistant

AI Support That Knows Your Business

A production RAG (Retrieval-Augmented Generation) chatbot built on an 86-document internal knowledge base — covering customer policies, support playbooks, seller operations, and the brand admin console.

Unlike generic AI assistants that hallucinate or give vague answers, this system retrieves the most relevant sections of your actual documentation before generating a response — so every answer is **grounded in your real content** and cites its sources.

THREE PERSONAS, ONE KNOWLEDGE BASE

Customer	Returns, shipping, product questions, policies — for shoppers
Concierge	Playbooks, escalation paths, VIP handling — for support teams
Brand Partner	Onboarding, commissions, admin console — for sellers

KEY CAPABILITIES

- Semantic search — 856 indexed document chunks
- Streaming responses for fast chat UX
- Custom ingestion pipeline for any docs
- Source citations alongside every answer
- Multi-persona architecture
- Deploys on any website or internal tool

WHAT THIS MEANS FOR YOUR TEAM

Support staff stop hunting through docs. Customers get instant accurate answers. Sellers self-serve onboarding. Every answer links back to the source so teams can verify and trust the output.
